

Scope of works

Our client had a number of their lights vandalised along an enclosed walkway and we were tasked with replacing the fittings with an energy saving option and also to come up with a way to protect the lights.

Overview

We replaced the existing luminaires with wirelessly controlled luminaires.

We maximized energy savings by dimming the lights when no one was present and smoothly control banks of lights to come on as people walked on the bridge.

Shopping Centre Bridge Canopy Lights

LOCATION: Southampton
CLIENT: ABM Technical Solutions

We carefully considered suitable protective caging that could go round the luminaires that were suspended off of a round beam.

We decided that it was best to get a bespoke flat backing plate made, which we could bolt a surface cage onto.

We had this templated and once we were happy with the sample, we completed the install.

The client was thrilled with the installation and we were happy with another bespoke project well done.
